

APHID PREDATORS OF THE GENUS *COCCINELLA* L.  
(COLEOPTERA: COCCINELLIDAE)

Mahdi Abbas Swail  
Department of Biology, College of Education, Wassit

ABSTRACT

This study deals with Aphid predators of the genus *Coccinella* L. recognized in different regions of the world. They have been arranged systematically according to Korschefsky's catalogue (1931). The list includes sites of study and the reference (works) that consider Coccinellids as predator. The study has revealed that there are thirteen Aphid predator species belonging to the genus *Coccinella* L. in different places of the world, although there might be other species that were not recorded by this work.

**Systematic list of Aphid predators of the genus Coccinella L.**

Many individuals of the genus *Coccinella* L. were recognized as predators to Aphids in different parts of the world. In this work the individuals have been listed in a classification list according to Korschefsky (1931). The list includes sites of the study and the references.

No.	Predator	Reference	Place
1	<i>Coccinella ancoralis</i> Germ.	Botto <i>et al</i> , 1979	Buenos aires, Field Studies
2	<i>C. arcuata</i> F.	Franzman, 1973  Broadly and Rogers, 1978.  Bhumannaver and Thontadarya, 1983.	Pangola Grass in north Queensland, Field Studies.  North Queensland pastures.  Karnataka.
3	<i>C. californica</i> Manne	Roitberg <i>et al</i> , 1979. Lves, 1981.	Res. Station, Canada.
4	<i>C. hieroglyphica</i> (L.)	Hippa <i>et al</i> , 1984.	Kevo Subarctic Res. Station.
5	<i>C. novemnotata</i> Hbst. d.	Carroll and Hoyt, 1984.	Res. Station in north-central Washington.
6	<i>C. prolongata</i> Cr.	Carroll and Hoyt, 1984.	Res. Station in north-central Washington.
7	<i>C. quatuordecimpunctata</i> tulata (L.)	Kaczmarek, 1973	Koszalin Adminstrative District, Poland.
8	<i>C. quinquepunctata</i> L.	Galecka, 1969 Kaczmarek, 1973	Warsaw, Poland. Poland.

### DISCUSSION

As the abovementioned list of Aphids preyed upon by *Coccinella L.* shows, the most predominant species of predators are *C. septempunctata* L., *C. repanda* Thaib. and *C. undecimpunctata* L. respectively, and they are polyphagous. This feature helps to increase the spread of the species and reduces the ability of using it in biological control because the monophagous species are more responsive to their preys and tend to limit the spread of the species.
